1. 테이블 생성 스크립트

```
가. CREATE TABLE member (
            member_id int PRIMARY KEY,
            address varchar2(255),
            email varchar2(255),
            name varchar2(255),
            password varchar2(255),
            role varchar2(10)
   )
나. CREATE TABLE cart (
            cart_id int PRIMARY KEY,
            member_id int
   )
다. CREATE TABLE cart_item (
            cart_item_id int PRIMARY KEY,
            count int NOT NULL,
            cart_id int,
            item_id int(20)
   )
라. CREATE TABLE item (
            item_id int PRIMARY KEY,
            item_detail varchar2(200) NOT NULL,
            item_nm varchar2(50) NOT NULL,
            price int NOT NULL
   )
마. CREATE TABLE order_item (
            order_item_id int PRIMARY KEY,
            count int NOT NULL,
            order_price int NOT NULL,
            item_id int,
            order_id int )
```

바. CREATE TABLE **orders** (order_id int PRIMARY KEY, order_status varchar2(255) member_id int)

2. ER 다이어 그램: JPA연관관계실습.mdj

3. 엔터티 클래스

```
가. Member
@Entity
@Table(name = "member")
@Getter
@Setter
@ToString
public class Member extends BaseEntity
    @ld
    @Column(name = "member_id")
    @GeneratedValue(strategy = GenerationType. AUTO)
    private Long id;
    private String name;
    @Column(unique = true)
    private String email;
    private String password;
    private String address;
    private String role;
}
나. Cart
@Entity
@Table(name = "cart")
@Getter
@Setter
@ToString
public class Cart extends BaseEntity
{
    @ld
    @Column(name = "cart_id")
    @GeneratedValue(strategy = GenerationType.AUTO)
    private Long id;
    @OneToOne(fetch = FetchType.LAZY)
    @JoinColumn(name = "member_id")
    private Member member;
```

```
}
다. Orders
@Entity
@Table(name = "orders")
@Getter
@Setter
public class Orders extends BaseEntity
    @ld
    @Column(name = "order_id")
    @GeneratedValue
    private Long id;
    @ManyToOne(fetch = FetchType.LAZY)
    @JoinColumn(name = "member_id")
    private Member member;
    private String orderStatus; // 주문상태
    @OneToMany(mappedBy = "orders", fetch = FetchType.LAZY)
    private List<OrderItem> orderItems = new ArrayList<OrderItem>();
}
라. OrderItem
@Entity
@Getter
@Setter
public class OrderItem extends BaseEntity
{
    @ld
    @Column(name = "order_item_id")
    @GeneratedValue
    private Long id;
    @ManyToOne(fetch = FetchType.LAZY)
    @JoinColumn(name = "item_id")
    private Item item;
```

@ManyToOne(fetch = FetchType.LAZY)
@JoinColumn(name = "order_id")

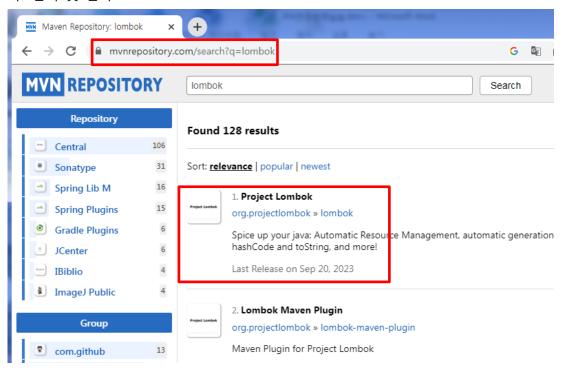

private Orders ordes;

```
// 주문가격
    private int orderPrice;
    private int count;
                             // 수량
}
마. CartItem
@Entity
@Table(name = "cart_item")
@Getter
@Setter
public class CartItem extends BaseEntity
{
    @ld
    @GeneratedValue
    @Column(name = "cart_item_id")
    private Long id;
    @ManyToOne(fetch = FetchType.LAZY)
    @JoinColumn(name = "cart_id")
    private Cart cart;
    @ManyToOne(fetch = FetchType.LAZY)
    @JoinColumn(name = "item_id")
    private Item item;
    private int count;
}
바. Item
@Entity
@Table(name = "item")
@Getter
@Setter
@ToString
public class Item extends BaseEntity
{
    @ld
    @Column(name = "item_id")
    @GeneratedValue(strategy = GenerationType.AUTO)
                                                                  // 상품코드
    private Long id;
    @Column(name="item_nm", nullable = false, length = 50)
                                                                  // 상품명
    private String itemNm;
```

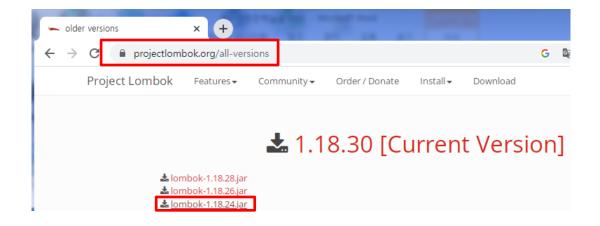

```
@Column(name = "price", nullable = false)
private int price;  // 가격

@Lob
@Column(name="item_details", nullable = false)
private String itemDetail;  // 상품 상세 설명
}
```

- 4. LOMBOK 사용: Getter/Setter 및 기타 자동처리 애노테이션 사용
- 가. 메이븐으로 설치: https://mvnrepository.com/repos/central
- 나. 검색 및 설치

다. 직접 다운로드

- 라. 다운로드 받은 위치로 이동해서 jar 파일 실행
- 주의: 만약 maven 프로젝트가 아닌 직접 다운을 받은 경우 실행 후 해당 프로젝트에서도 build path에 외부 라이브러리로 직접 등록해야 함
- 예시: maven 프로젝트에서 다운받은 경우
